Candidate shapes $f(r)$ for $g_{E1}(r) = e\,r\,[e_Q + \kappa f(r)]$
vs lattice string breaking ($n_f = 2$, $m_\pi \approx 640$ MeV)
rms radii of states
in your E1 fits
A: two-level mixing, Bali Eq. (85) ($c = 0.914$)
A: pure two-level ($c = 1$, constant g)
B: Hill, fit: $r_0 = 1.23$ fm, $n = 44$
C: tanh, fit: $r_0 = 1.23$ fm, $w = 0.058$ fm
Bali et al. 2005, $\sin^2\theta$ (Table I)
$r_c \simeq 1.25$ fm
$f(r)$ (meson-pair probability)
$f(r)$, log scale
r (fm)
